

RSPO IT system – current status and future outlook

Presenting Author: Olivier van Oort, Oli4 Informatica Management
Heemstede, Netherlands

In 2007 RSPO set its first steps to a traceability system delivered and operated by UTZ Certified. On July 23rd 2012 its successor – RSPO eTrace – has become operational. In 2011 a review has been done on the old system and the way it supports the traceability that RSPO requires. On the basis of that review the decision was made by the Standing Committee T&T to start an investigation into the requirements and specifications that RSPO really needs in a traceability system. This research will be finished around the time of this RT10 and will be decided upon by the Executive Board.

In this presentation you will find an overview of the experiences with RSPO eTrace so far, what is planned ahead in eTrace for the near future and we will dig deeper into the needs of RSPO for a traceability system that supports RSPO for the future.
